

Assignment No. 9

Title: Creating an Application in Salesforce.com using Apex programming Language.

Problem Statement: Creating an Application in Salesforce.com using Apex programming Language.

Objective:

1. To student Apex Programming language
2. To create an application in Salesforce.com

Outcome:

Application in Salesforce.com using Apex programming Language.

Theory:

Salesforce is a cloud-based Customer Relationship Management (CRM) platform that allows users to create custom applications using declarative tools and programmatic logic. Apex is a strongly typed, object-oriented programming language used in Salesforce to execute business logic on the Salesforce platform.

Custom objects in Salesforce function similarly to database tables. Each custom object stores records and fields. In Apex, custom objects are referenced using the API name followed by __c. For example, a custom object named "Student" becomes Student__c in Apex.

Apex supports database operations using DML (Data Manipulation Language) statements such as insert, update, and delete. Data retrieval is performed using

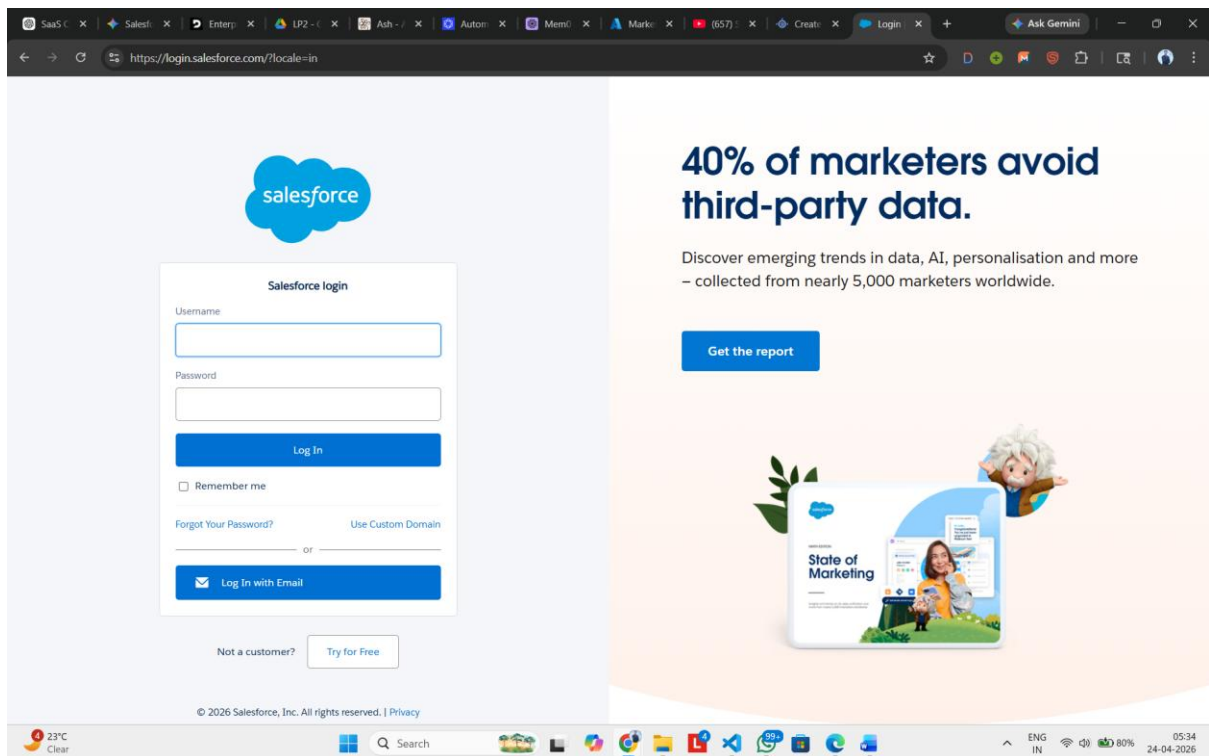

SOQL (Salesforce Object Query Language), which is similar to SQL but specifically designed for Salesforce objects.

The Developer Console provides an environment to write, execute, and debug Apex code.

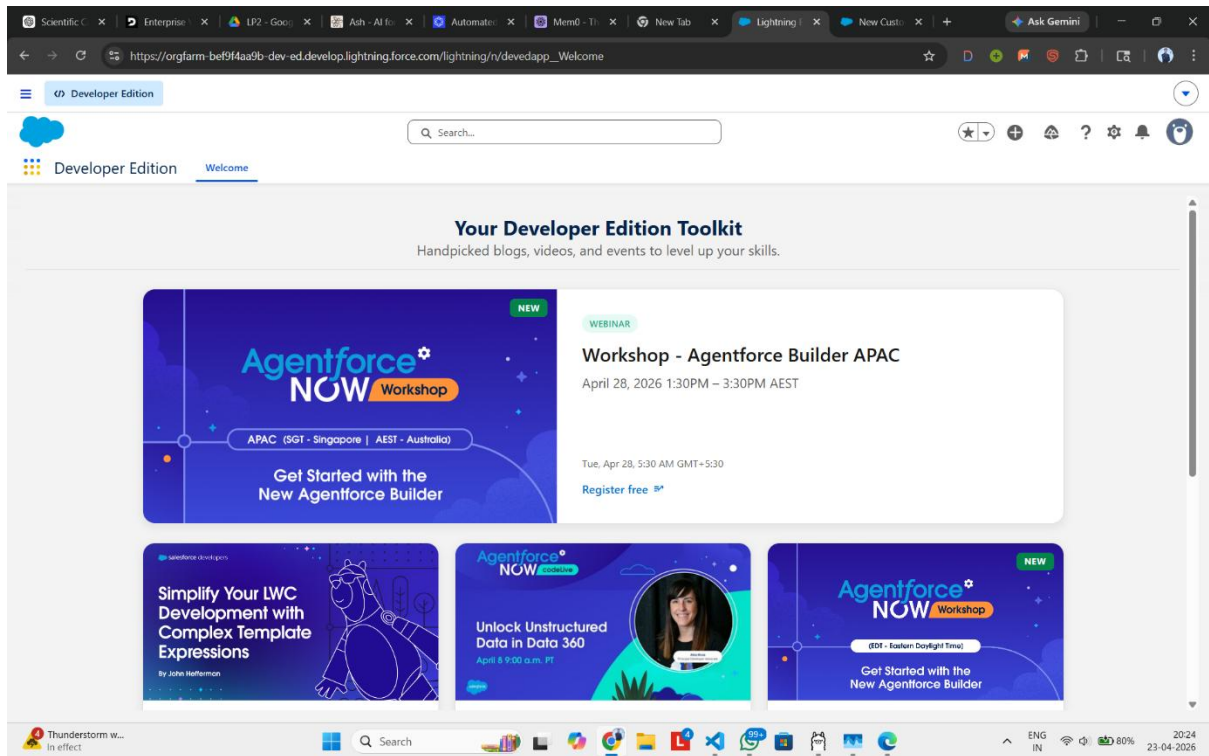

The “Execute Anonymous” feature allows developers to test Apex code without creating a permanent method

Procedure:

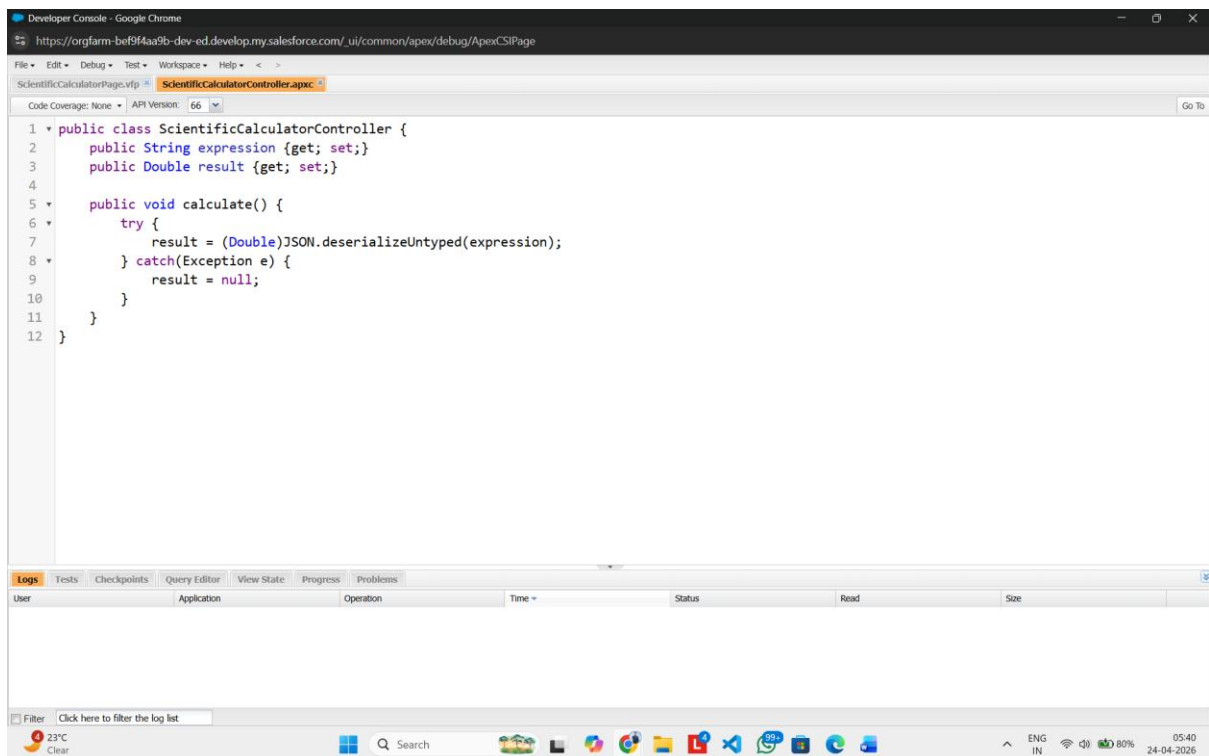

Step 1: Signup or login

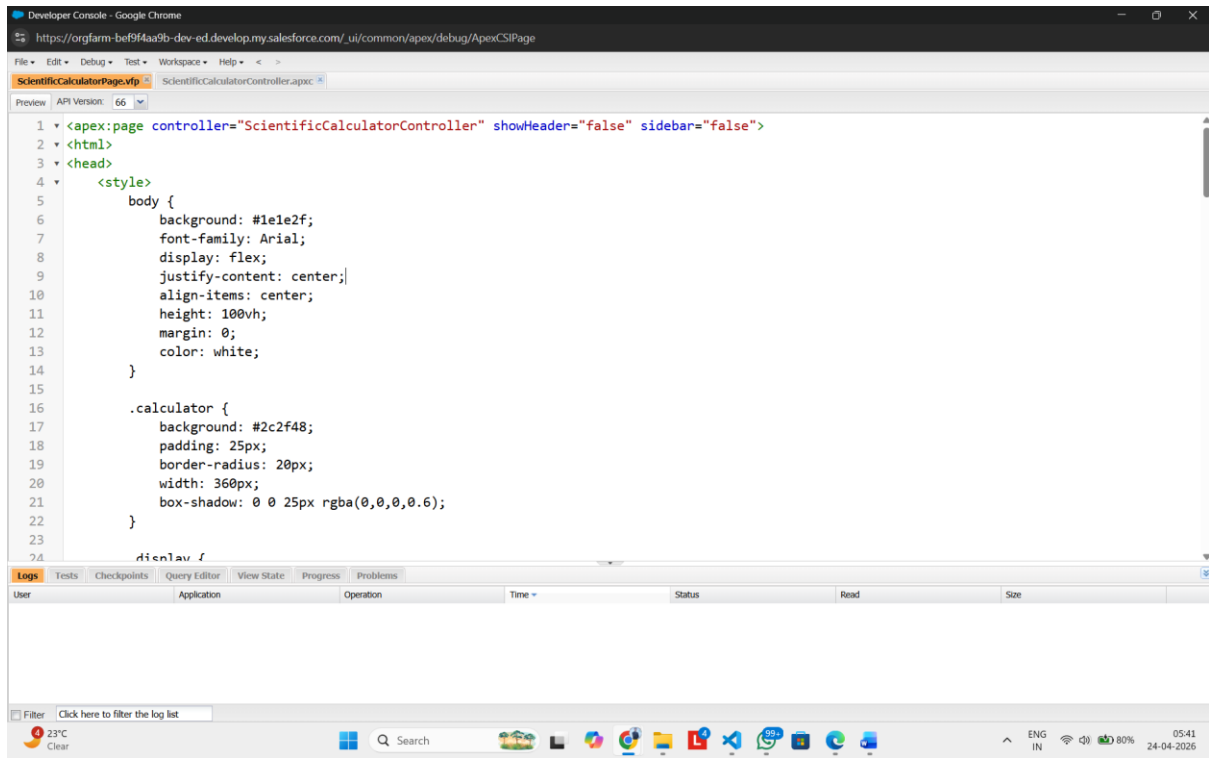

Step 2: After this you will reach the Dashboard

Step 3: Goto Seup>Developer Console. Create new Apex class

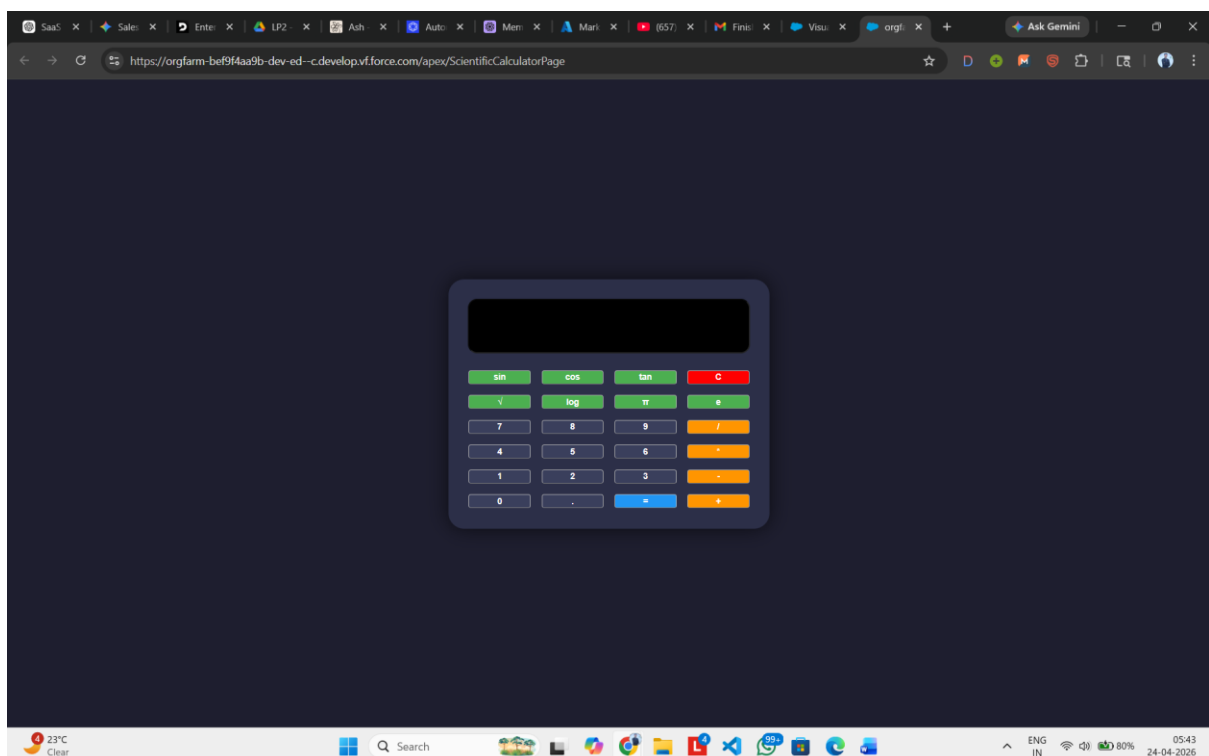

Step 4: Similarly, Create new VisualForce Page.

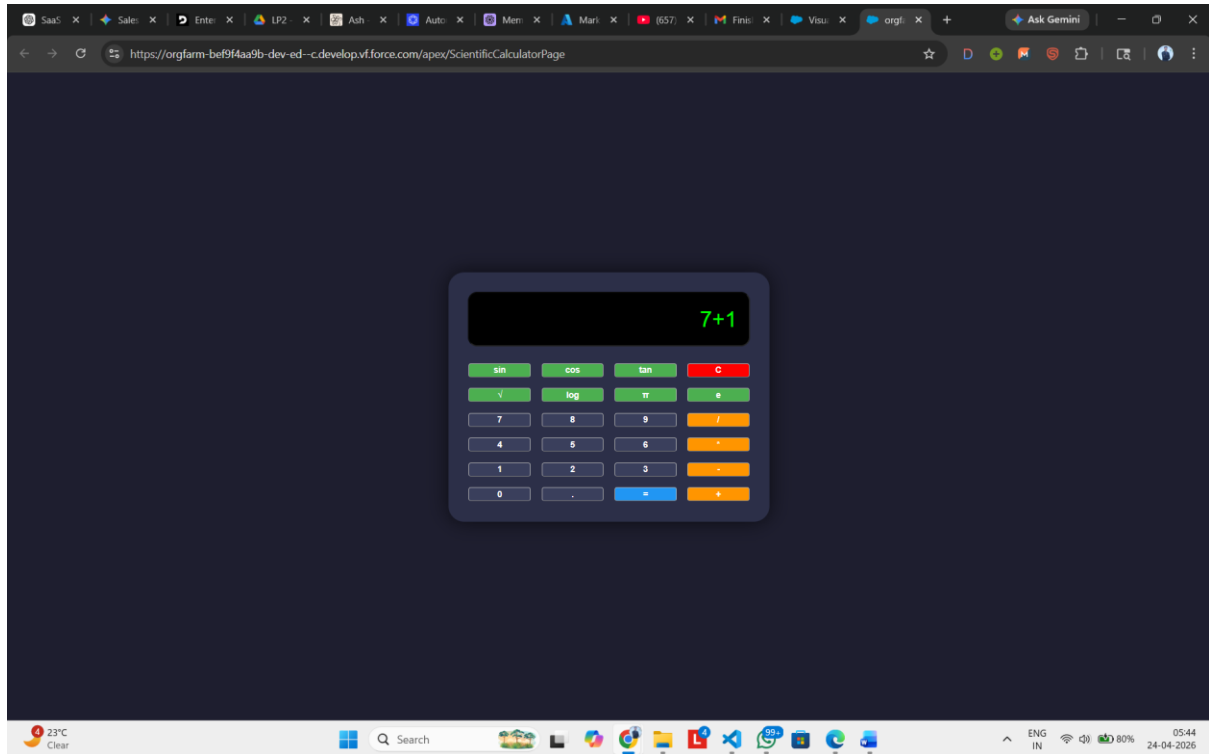

The screenshot shows the Salesforce Developer Console with the Visualforce page markup for ScientificCalculatorPage.vfp. The markup includes an apex:page tag with controller="ScientificCalculatorController", showHeader="false", and sidebar="false". It also includes an HTML structure with a head section containing a style block for the body and a calculator section with specific styling.

```
1 <apex:page controller="ScientificCalculatorController" showHeader="false" sidebar="false">
2 <html>
3 <head>
4 <style>
5     body {
6         background: #1e1e2f;
7         font-family: Arial;
8         display: flex;
9         justify-content: center;
10        align-items: center;
11        height: 100vh;
12        margin: 0;
13        color: white;
14    }
15
16    .calculator {
17        background: #2c2f48;
18        padding: 25px;
19        border-radius: 20px;
20        width: 360px;
21        box-shadow: 0 0 25px rgba(0,0,0,0.6);
22    }
23
24    </style>
25 </head>
26 <body>
27     <apex:include component="ScientificCalculatorController" />
28 </body>
29 </html>
30 </apex:page>
```

Step 5: Click preview on ScientificCalculatorPage.vfp and then a new tab will open with URL.

Conclusion: Hence, we have successfully created an application in Salesforce.com using Apex programming language.
